opencl.pptx mjb – March 10, 2022

- OpenCL consists of two parts: a C/C++-callable API and a C-ish programming language.
- The OpenCL programming language can run on NVIDIA GPUs, AMD GPUs, Intel CPUs, Intel GPUs, mobile devices, and (supposedly) FPGAs (Field-Programmable Gate Arrays).
- But, OpenCL is at its best on compute devices with large amounts of **data parallelism**, which usually implies GPU usage.
- You break your computational problem up into lots and lots of small pieces. Each piece gets farmed out to threads on the GPU.
- Each thread wakes up and is able to ask questions about where it lives in the entire collection of (thousands of) threads. From that, it can tell what it is supposed to be working on.
- OpenCL can share data, and interoperate, with OpenGL
- There is a JavaScript implementation of OpenCL, called WebCL
- There is a JavaScript implementation of OpenGL, called WebGL
- WebCL can share data, and interoperate, with WebGL
- The GPU does not have a stack, and so the OpenCL C-ish programming language cannot do recursion and cannot make function calls. It also can't use pointers.

The Khronos Group

http://www.khronos.org/opencl/

http://en.wikipedia.org/wiki/OpenCL

Who is Part of the Khronos Group?

Active OpenCL Members

Implementers Desktop/Mobile/Embedded/FPGA

Core API and Language Specs

Portable Kernel Intermediate Language

Working Group Members Apps/Tools/Tests/Courseware

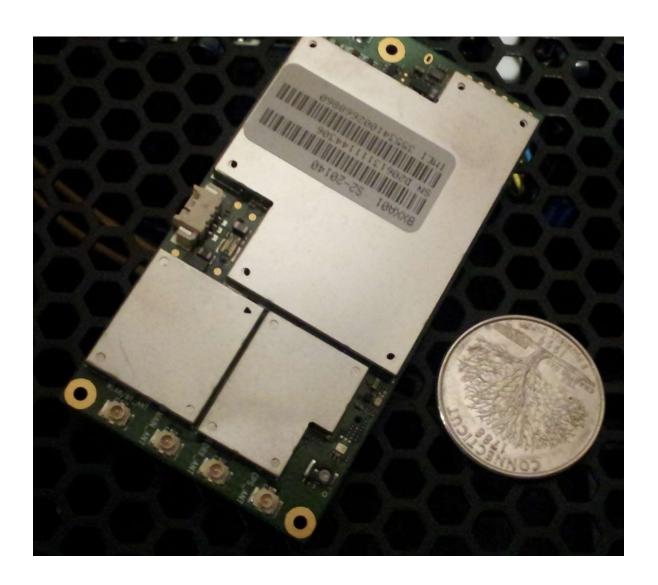

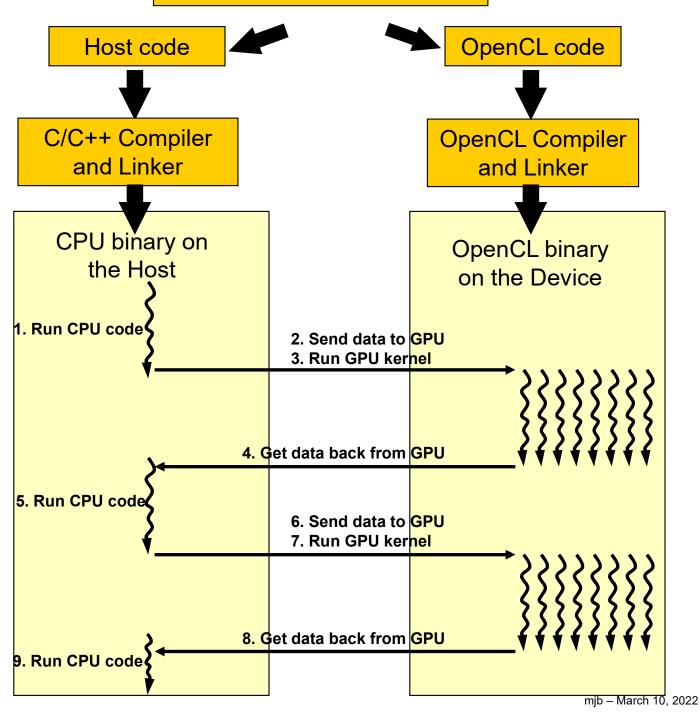

Example of using OpenCL in a System-on-a-Chip: Qualcomm Node – Full Linux and OpenCL

The OpenCL Paradigm

C/C++ Program plus OpenCL

OpenCL wants you to break the problem up into Pieces

If you were writing in **C/C++**, you would say:

```
void
ArrayMult( int n, float *a, float *b, float *c)
{
    for ( int i = 0; i < n; i++ )
        c[i] = a[i] * b[i];
}</pre>
```

If you were writing in **OpenCL**, you would say:

```
kernel
void
ArrayMult( global float *dA, global float *dB, global float *dC)
{
    int gid = get_global_id ( 0 );
    dC[gid] = dA[gid] * dB[gid];
}
```

Think of this as having an implied for-loop around it, looping through all possible values of *gid*

The OpenCL Language also supports Vector Parallelism

OpenCL code can be vector-oriented, meaning that it can perform a single instruction on multiple data values at the same time (SIMD).

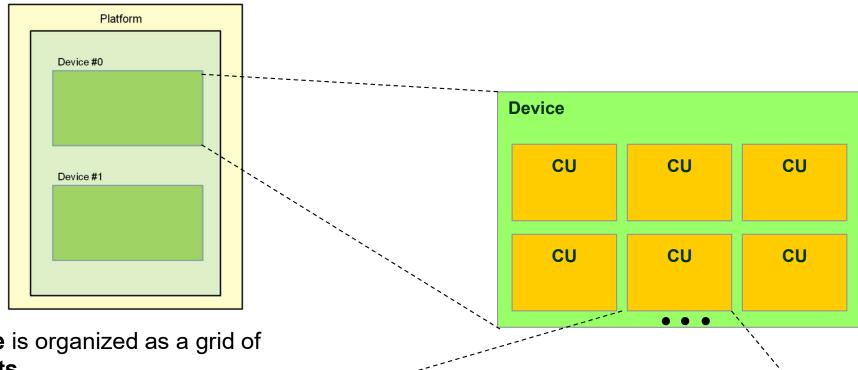

Vector data types are: charn, intn, floatn, where n = 2, 4, 8, or 16.

```
float4 f, g;
f = (float4)( 1.f, 2.f, 3.f, 4.f );
float16 a16, x16, y16, z16;
f.x = 0.;
f.xy = g.zw;
x16.s89ab = f;
float16 a16 = x16 * y16 + z16;
```

(Note: just because the language supports it, doesn't mean the hardware does.)

Compute Units and Processing Elements are Arranged in Grids

A GPU **Device** is organized as a grid of **Compute Units**.

Each Compute Unit is organized as a grid of **Processing Elements**.

So in NVIDIA terms, their Turing GPU has 68 Compute Units, each of which has 64 Processing Elements, for a grand total of 4,352 Processing Elements.

| _ | Compute Unit | | | | | | | | |
|---|--------------|----|----|----|----|--|--|--|--|
| | PE | PE | PE | PE | PE | | | | |
| | PE | PE | PE | PE | PE | | | | |
| | PE | PE | PE | PE | PE | | | | |

Work-Groups are Arranged in Grids

The GPU's workload is divided into a Grid of Work-Groups

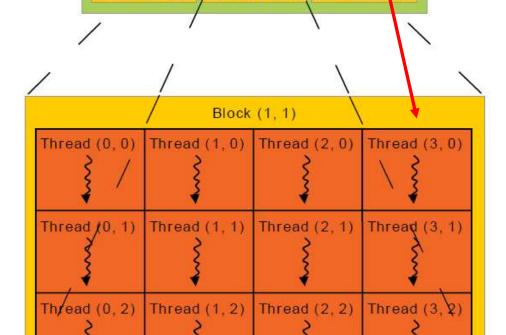

Each Block's workload is divided into a Grid of Work-Items

Block (0, 0)

Block (0, 1)

Grid

Block (1, 0)

Block (1, 1)

Block (2, 0)

Block (2, 1)

Grid of Work-Items

OpenCL Software Terminology: Work-Groups and Work-Items are Arranged in Grids

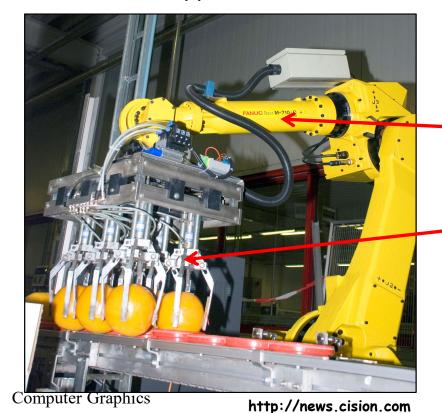

An OpenCL program is organized as a grid of Work-Groups.

Each Work-Group is organized as a grid of **Work-Items**.

In terms of hardware, a Work-Group runs on a Compute Unit and a Work-Item runs on a Processing Element (PE).

One thread is assigned to each Work-Item.

Threads are swapped on and off the PEs.

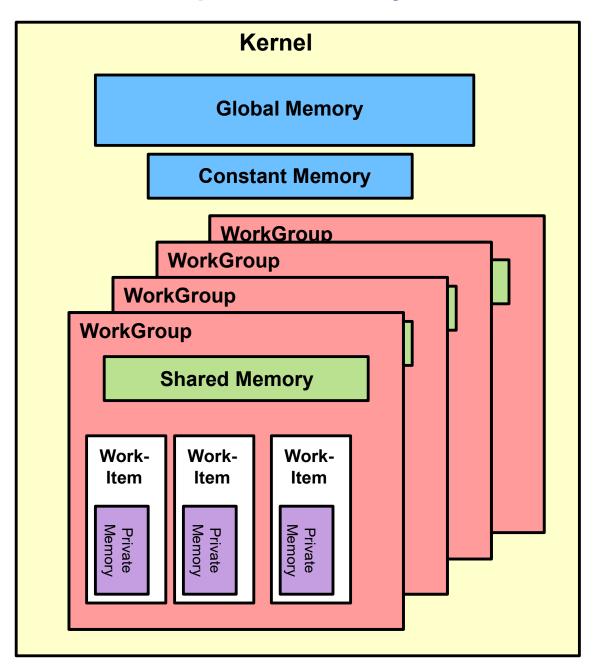

| Grid | | |
|-----------------|-----------------|-----------------|
| Work-Group 0 | Work-Group 1 | Work-Group 2 |
| Work-Group | Work-Group 4 | Work-Group 5 |

Work-Group 4

| Work-Item | Work-Item | Work-Item | Work-Item | Work-Item |
|-----------|-----------|-----------|-----------|-----------|
| 0 | 1 | 2 | 3 | 4 |
| Work-Item | Work-Item | Work-Item | Work-Item | Work-Item |
| 5 | 6 | 7 | 8 | 9 |
| Work-Item | Work-Item | Work-Item | Work-Item | Work-Item |
| 10 | 11 | 12 | 13 | 14 |

mp – March 10, 2022

OpenCL Memory Model

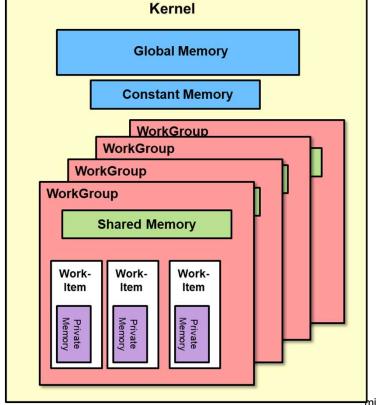

Rules

- Threads can share memory with the other Threads in the same Work-Group
- Threads can synchronize with other Threads in the same Work-Group
- Global and Constant memory is accessible by all Threads in all Work-Groups
- Global and Constant memory is often cached inside a Work-Group
- Each Thread has registers and private memory

• Each Work-Group has a maximum number of registers it can use. These are

divided equally among all its Threads

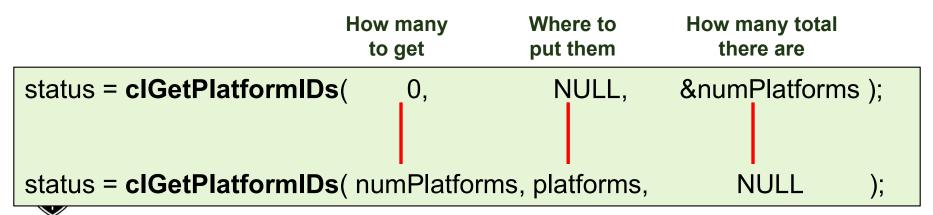

Querying the Number of Platforms (usually one)

This way of querying information is a recurring OpenCL pattern (get used to it):

OpenCL Error Codes

This one is #define'd as zero. All the others are negative.

CL SUCCESS CL DEVICE NOT FOUND CL DEVICE NOT AVAILABLE CL COMPILER NOT AVAILABLE CL MEM OBJECT ALLOCATION FAILURE CL OUT OF RESOURCES CL OUT OF HOST MEMORY CL PROFILING INFO NOT AVAILABLE CL MEM COPY OVERLAP CL IMAGE FORMAT MISMATCH CL IMAGE FORMAT NOT SUPPORTED CL BUILD PROGRAM FAILURE CL MAP FAILURE CL INVALID VALUE CL INVALID DEVICE TYPE CL INVALID PLATFORM CL INVALID DEVICE CL INVALID CONTEXT

CL INVALID QUEUE PROPERTIES CL INVALID COMMAND QUEUE CL INVALID HOST PTR CL INVALID MEM OBJECT CL INVALID IMAGE FORMAT DESCRIPTOR CL INVALID IMAGE SIZE CL INVALID SAMPLER CL INVALID BINARY CL_INVALID_BUILD OPTIONS CL INVALID PROGRAM CL INVALID PROGRAM EXECUTABLE CL INVALID KERNEL NAME CL INVALID KERNEL DEFINITION CL INVALID KERNEL CL INVALID ARG INDEX CL INVALID ARG VALUE CL INVALID ARG SIZE CL INVALID KERNEL ARGS CL INVALID WORK DIMENSION

A Way to Print OpenCL Error Codes – get this from our Reference Page

```
struct errorcode
               statusCode;
    cl int
    char *
               meaning;
ErrorCodes[] =
    { CL SUCCESS,
    { CL_DEVICE NOT_FOUND,
                                           "Device Not Found"
    { CL DEVICE NOT AVAILABLE,
                                            "Device Not Available"
    { CL INVALID MIP LEVEL,
                                            "Invalid MIP Level"
    {CL_INVALID_GLOBAL_WORK_SIZE, "Invalid Global Work Size"
};
void
PrintCLError( cl int errorCode, char * prefix, FILE *fp )
    if( errorCode == CL SUCCESS )
         return;
    const int numErrorCodes = sizeof( ErrorCodes ) / sizeof( struct errorcode );
    char * meaning = " ";
    for( int i = 0; i < numErrorCodes; i++ )
         if( errorCode == ErrorCodes[i].statusCode )
              meaning = ErrorCodes[i].meaning;
              break;
    fprintf( fp, "%s %s\n", prefix, meaning );
```

Querying the Number of Devices on a Platform

```
// find out how many devices are attached to each platform and get their ids:

status = clGetDevicelDs( platform, CL_DEVICE_TYPE_ALL, 0, NULL, &numDevices );

devices = new cl_device_id[ numDevices ];

status = clGetDevicelDs( platform, CL_DEVICE_TYPE_ALL, numDevices, devices, NULL );
```

Getting Just the GPU Device(s)

```
cl_device_id device;
status = clGetDevicelDs( platform, CL_DEVICE_TYPE_GPU, ), &device, NULL );
```

Querying the Device (this is really useful!), I

```
// find out how many platforms are attached here and get their ids:
cl uint numPlatforms;
status = clGetPlatformlDs(0, NULL, &numPlatforms);
if( status != CL SUCCESS )
     fprintf( stderr, "clGetPlatformIDs failed (1)\n" );
fprintf( OUTPUT, "Number of Platforms = %d\n", numPlatforms );
cl platform id *platforms = new cl platform id[ numPlatforms ];
status = clGetPlatformIDs( numPlatforms, platforms, NULL );
if( status != CL SUCCESS )
     fprintf( stderr, "clGetPlatformIDs failed (2)\n" );
cl uint numDevices;
cl device id *devices;
for( int i = 0; i < (int)numPlatforms; i++)
{
     fprintf( OUTPUT, "Platform #%d:\n", i );
     size t size;
     char *str;
     clGetPlatformInfo( platforms[i], CL PLATFORM NAME, 0, NULL, &size );
     str = new char [ size ];
     clGetPlatformInfo( platforms[i], CL PLATFORM NAME, size, str, NULL );
     fprintf( OUTPUT, "\tName = '%s'\n", str );
     delete[] str;
     clGetPlatformInfo( platforms[i], CL PLATFORM VENDOR, 0, NULL, &size );
     str = new char [ size ];
     clGetPlatformInfo( platforms[i], CL PLATFORM_VENDOR, size, str, NULL );
     fprintf( OUTPUT, "\tVendor = '%s'\n", str );
     delete[] str;
```

Querying the Device, II

```
clGetPlatformInfo( platforms[i], CL PLATFORM VERSION, 0, NULL, &size );
str = new char [ size ];
clGetPlatformInfo( platforms[i], CL PLATFORM VERSION, size, str, NULL );
fprintf( OUTPUT, "\tVersion = '%s'\n", str );
delete[] str;
clGetPlatformInfo( platforms[i], CL PLATFORM PROFILE, 0, NULL, &size );
str = new char [ size ];
clGetPlatformInfo( platforms[i], CL_PLATFORM_PROFILE, size, str, NULL );
fprintf( OUTPUT, "\tProfile = '%s'\n", str );
delete[] str;
// find out how many devices are attached to each platform and get their ids:
status = clGetDevicelDs( platforms[i], CL_DEVICE_TYPE_ALL, 0, NULL, &numDevices );
if( status != CL SUCCESS )
     fprintf( stderr, "clGetDeviceIDs failed (2)\n" );
devices = new cl device id[ numDevices ];
status = clGetDevicelDs( platforms[i], CL DEVICE TYPE ALL, numDevices, devices, NULL );
if( status != CL SUCCESS )
     fprintf( stderr, "clGetDeviceIDs failed (2)\n" );
for( int j = 0; j < (int)numDevices; j++ )
    fprintf( OUTPUT, "\tDevice #%d:\n", j );
     size t size;
     cl device type type;
     cl uint ui;
     size t sizes[3] = \{0, 0, 0\};
     clGetDeviceInfo( devices[i], CL DEVICE TYPE, sizeof(type), &type, NULL );
     fprintf( OUTPUT, "ttType = 0x\%04x = ", type );
```

Com

Querying the Device, III

```
switch(type)
     case CL DEVICE TYPE CPU:
         fprintf( OUTPUT, "CL DEVICE TYPE CPU\n" );
         break;
     case CL DEVICE TYPE GPU:
         fprintf( OUTPUT, "CL DEVICE TYPE GPU\n" );
         break;
     case CL DEVICE TYPE ACCELERATOR:
         fprintf( OUTPUT, "CL DEVICE TYPE ACCELERATOR\n" );
         break;
     default:
         fprintf( OUTPUT, "Other...\n" );
         break;
clGetDeviceInfo( devices[j], CL DEVICE VENDOR ID, sizeof(ui), &ui, NULL );
fprintf( OUTPUT, "\t\tDevice Vendor ID = 0x\%04x\n", ui );
clGetDeviceInfo( devices[j], CL DEVICE MAX COMPUTE UNITS, sizeof(ui), &ui, NULL );
fprintf( OUTPUT, "\t\tDevice Maximum Compute Units = %d\n", ui );
clGetDeviceInfo( devices[j], CL DEVICE MAX WORK ITEM DIMENSIONS, sizeof(ui), &ui, NULL );
fprintf( OUTPUT, "\t\tDevice Maximum Work Item Dimensions = %d\n", ui );
clGetDeviceInfo( devices[i], CL DEVICE MAX WORK ITEM SIZES, sizeof(sizes), sizes, NULL );
fprintf( OUTPUT, "\t\tDevice Maximum Work Item Sizes = \%d x \%d\n", sizes[0], sizes[1], sizes[2]);
clGetDeviceInfo( devices[j], CL DEVICE MAX WORK GROUP SIZE, sizeof(size), &size, NULL );
fprintf( OUTPUT, "\t\tDevice Maximum Work Group Size = %d\n", size );
clGetDeviceInfo( devices[j], CL DEVICE MAX CLOCK FREQUENCY, sizeof(ui), &ui, NULL );
fprintf( OUTPUT, "\t\tDevice Maximum Clock Frequency = %d MHz\n", ui );
```

Typical Values from Querying the Device

```
Number of Platforms = 1
Platform #0.
         Name = 'NVIDIA CUDA'
         Vendor = 'NVIDIA Corporation'
         Version = 'OpenCL 1.1 CUDA 4.1.1'
         Profile = 'FULL PROFILE'
         Device #0:
                  Type = 0x0004 = CL_DEVICE_TYPE_GPU
                  Device Vendor ID = 0x10de
                  Device Maximum Compute Units = 15
                  Device Maximum Work Item Dimensions = 3
                  Device Maximum Work Item Sizes = 1024 x 1024 x 64
                  Device Maximum Work Group Size = 1024
                  Device Maximum Clock Frequency = 1401 MHz
                  Kernel Maximum Work Group Size = 1024
                  Kernel Compile Work Group Size = 0 x 0 x 0
                  Kernel Local Memory Size = 0
```

Querying to see what extensions are supported on this device

Querying to see what extensions are supported on this device

This is the big one you are looking for. It shows that this OpenCL system can interoperate with OpenGL.

This one is handy too. It shows that this OpenCL system can support 64-bit floating point (i.e., double precision).

Steps in Creating and Running an OpenCL program

- 1. Program header
- 2. Allocate the host memory buffers
- 3. Create an OpenCL context
- 4. Create an OpenCL command queue
- 5. Allocate the device memory buffers
- 6. Write the data from the host buffers to the device buffers
- 7. Read the kernel code from a file
- 8. Compile and link the kernel code
- 9. Create the kernel object
- 10. Setup the arguments to the kernel object
- 11. Enqueue the kernel object for execution
- 12. Read the results buffer back from the device to the host
- 13. Clean everything up

1. .cpp Program Header

```
#include <stdio.h>
#include <math.h>
#include <string.h>
#include <stdlib.h>
#include <omp.h> // for timing

#include "cl.h"
```

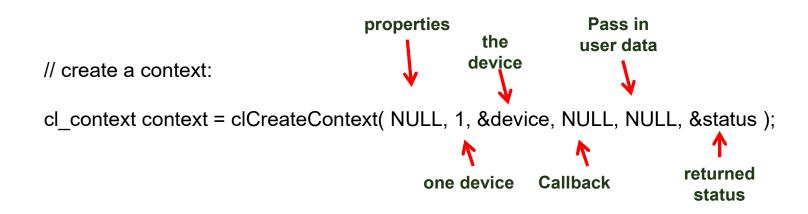

2. Allocate the Host Memory Buffers

This could have also been done like this:

```
// allocate the host memory buffers:
                                                         float hA[ NUM ELEMENTS ];
float * hA = new float [ NUM ELEMENTS ];
                                                Global memory and the heap typically have lots more
float * hB = new float [ NUM ELEMENTS ];
                                                space than the stack does. So, typically, you do not want
float * hC = new float [ NUM ELEMENTS ];
                                                to allocate a large array like this as a local variable.
                                                (Here, it's being done on the heap. It could also have
// fill the host memory buffers:
                                                been done in global memory.)
for(int i = 0; i < NUM ELEMENTS; i++)
           hA[i] = hB[i] = sqrtf((float)i);
// array size in bytes (will need this later):
size t dataSize = NUM ELEMENTS * sizeof( float );
// opencl function return status:
cl int status;
                                  // test against CL SUCCESS
```

3. Create an OpenCL Context

cl_context context = clCreateContext(NULL, 1, &device, NULL, NULL, &status);

4. Create an OpenCL Command Queue

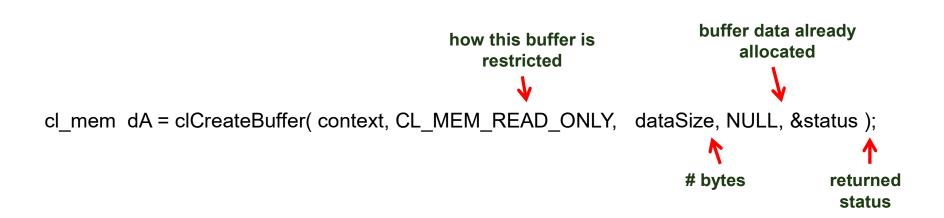

// create a command queue:

cl_command_queue cmdQueue = clCreateCommandQueue(context, device, 0, &status);

5. Allocate the Device Memory Buffers

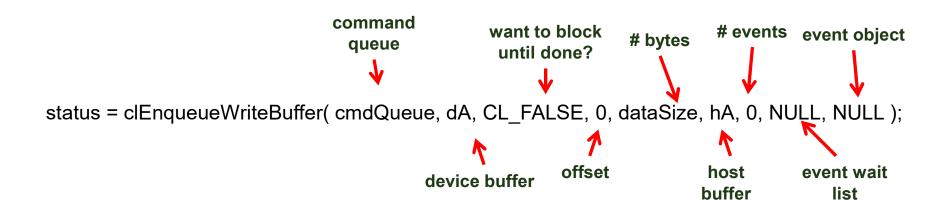

The read and write terminology is with respect to the OpenCL device.

So, CL_MEM_READ_ONLY means that the OpenCL device can only get this data – it can't send it back to the host CPU. Other options are CL_MEM_WRITE_ONLY and CL_MEM_READ_WRITE.

6. Write the Data from the Host Buffers to the Device Buffers

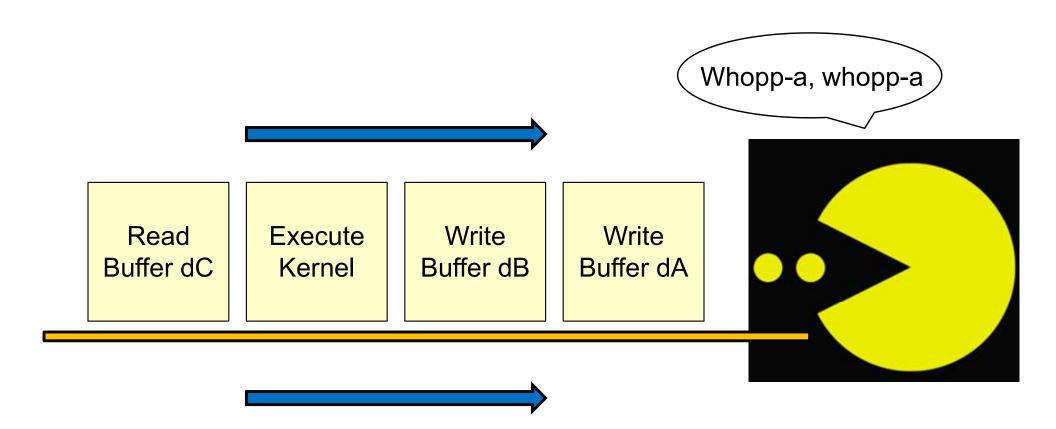

```
// enqueue the 2 commands to write data into the device buffers:
```

```
status = clEnqueueWriteBuffer( cmdQueue, dA, CL_FALSE, 0, dataSize, hA, 0, NULL, NULL); status = clEnqueueWriteBuffer( cmdQueue, dB, CL_FALSE, 0, dataSize, hB, 0, NULL, NULL);
```

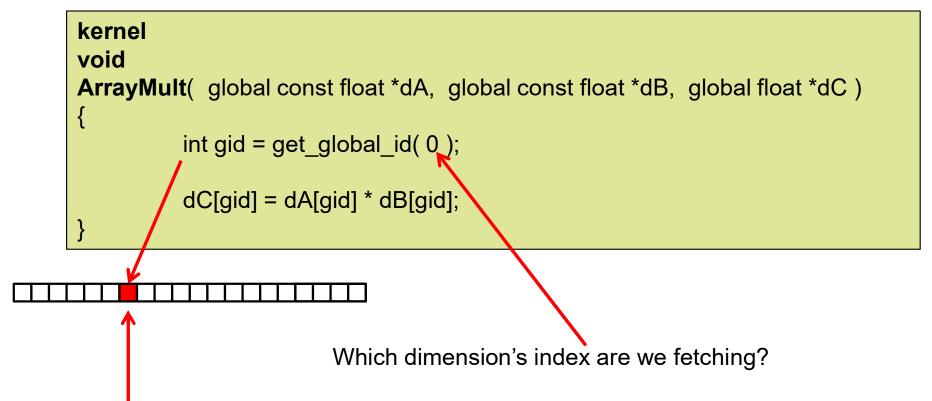

Enqueuing Works Like a Conveyer Belt

Oregon State
University
Computer Graphics

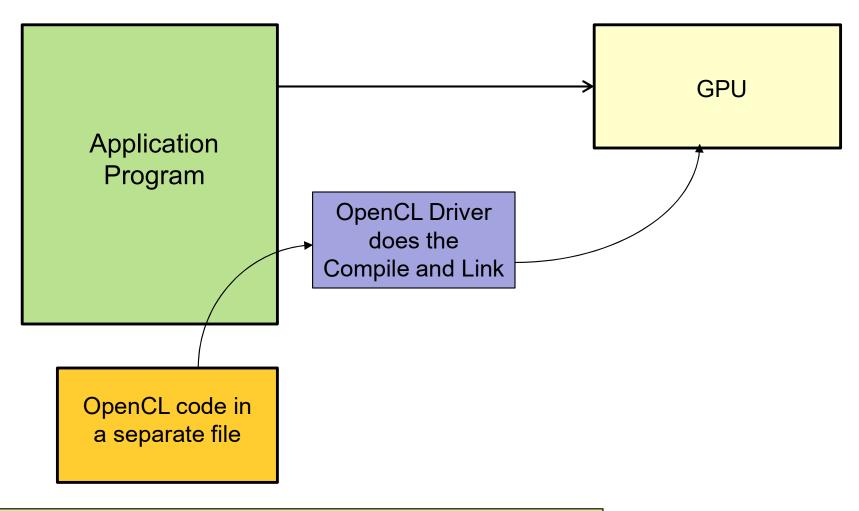

gid = which element we are

dealing with right now.

$$0 = X$$
, $1 = Y$, $2 = Z$

Since this is a 1D problem, X is the only index we need to get.

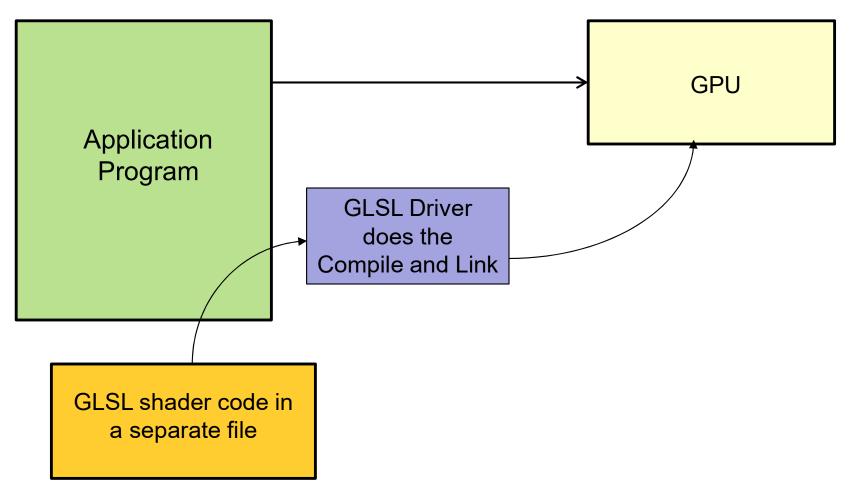

OpenCL code is compiled in the Driver . . .

```
kernel void
ArrayMult( global float *A, global float *B, global float *C )
{
    int gid = get_global_id ( 0 );

    C[gid] = A[gid] * B[gid];
}
```

(... just like OpenGL's GLSL Shader code is compiled in the driver) ³⁴

```
void main()
           vec3 newcolor = texture2D( uTexUnit, vST) ).rgb;
           newcolor = mix( newcolor, vColor.rgb, uBlend );
           gl FragColor = vec4(u LightIntensity*newcolor, 1.);
  University
```

Computer Graphics

7. Read the Kernel Code from a File into a Character Array

"r" should work, since the .cl file is pure ASCII text, but some people report that it doesn't work unless you use "rb"

```
const char *CL FILE NAME = { "arraymult.cl" };
                                                           Watch out for the '\r' + '\n' problem!
FILE *fp = fopen( CL_FILE_NAME, "r"
                                                            (See the next slide.)
if( fp == NULL )
           fprintf( stderr, "Cannot open OpenCL source file '%s'\n", CL FILE NAME );
           return 1:
// read the characters from the opencl kernel program:
fseek(fp, 0, SEEK END);
size t fileSize = ftell(fp);
fseek( fp, 0, SEEK_SET );
char *clProgramText = new char[ fileSize+1 ];
size t n = fread(clProgramText, 1, fileSize, fp);
clProgramText[fileSize] = '\0';
fclose(fp);
```

A Warning about Editing on Windows and Running on Linux

Some of you will end up having strange, unexplainable problems with your csh scripts, .cpp prograns, or .cl programs. This could be because you are typing your code in on Windows (using Notepad or Wordpad or Word) and then running it on Linux. Windows likes to insert an extra carriage return ('\r') at the end of each line, which Linux interprets as a garbage character.

You can test this by typing the Linux command:

od -c loop.csh

which will show you all the characters, even the '\r' (which you don't want) and the '\n' (newlines, which you do want).

To get rid of the carriage returns, enter the Linux command:

Then run loop1.csh

Or, on some systems, there is a utility called *dos2unix* which does this for you:

Sorry about this. Unfortunately, this is a fact of life when you mix Windows and Linux.

- You pre-compile your OpenCL code with an external compiler
- Your OpenCL code gets turned into an intermediate form known as SPIR-V
- SPIR-V gets turned into fully-compiled code at runtime

Advantages:

- 1. Software vendors don't need to ship their OpenCL source
- 2. Syntax errors appear during the SPIR-V step, not during runtime
- 3. Software can launch faster because half of the compilation has already taken place
- 4. This guarantees a common front-end syntax
- 5. This allows for other language front-ends

8. Compile and Link the Kernel Code

```
// create the kernel program on the device:
char * strings [ 1 ];
                                 // an array of strings
strings[0] = clProgramText;
cl program program = clCreateProgramWithSource( context, 1, (const char **)strings, NULL, &status );
delete [] clProgramText;
// build the kernel program on the device:
char *options = { "" };
status = clBuildProgram( program, 1, &device, options, NULL, NULL );
if( status != CL SUCCESS )
                                  // retrieve and print the error messages:
           size t size;
           clGetProgramBuildInfo(program, devices[0], CL PROGRAM BUILD LOG, 0, NULL, &size);
           cl char *log = new cl char[ size ];
           clGetProgramBuildInfo( program, devices[0], CL_PROGRAM_BUILD_LOG, size, log, NULL );
           fprintf( stderr, "clBuildProgram failed:\n%s\n", log );
           delete [] log;
```

How does that array-of-strings thing actually work?

```
char *ArrayOfStrings[3];
ArrayOfStrings[0] = ...one commonly-used function...";
ArrayOfStrings[1] = " . . . another commonly-used function. . . ";
ArrayOfStrings[2] = " . . . the real OpenCL code . . . ";
cl_program program = clCreateProgramWithSource( context, 1, (const char **) ArrayOfStrings, NULL, &status );
```

These are two ways to provide a single character buffer:

```
char *buffer[1];
buffer[0] = " . . . the entire OpenCL code . . . ";
cl_program program = clCreateProgramWithSource( context, 1, (const char **) buffer, NULL, &status );
```

```
char *buffer = " . . . the entire OpenCL code . . . ";
cl_program program = clCreateProgramWithSource( context, 1, (const char **) &buffer, NULL, &status );
```

Why use an array of strings to hold the OpenCL program, instead of just a single string?

- You can use the same OpenCL source and insert the appropriate "#defines" at the beginning
- 2. You can insert a common header file (≈ a .h file)
- 3. You can simulate a "#include" to re-use common pieces of code

9. Create the Kernel Object

cl_kernel kernel = clCreateKernel(program, "ArrayMult", &status);

```
status = clSetKernelArg( kernel, 0, sizeof(cl_mem), &dA ), status = clSetKernelArg( kernel, 1, sizeof(cl_mem), &dB ); status = clSetKernelArg( kernel, 2, sizeof(cl_mem), &dC ),
```

kernel void

ArrayMult(global const float *dA, global const float *dB, global float *dC)

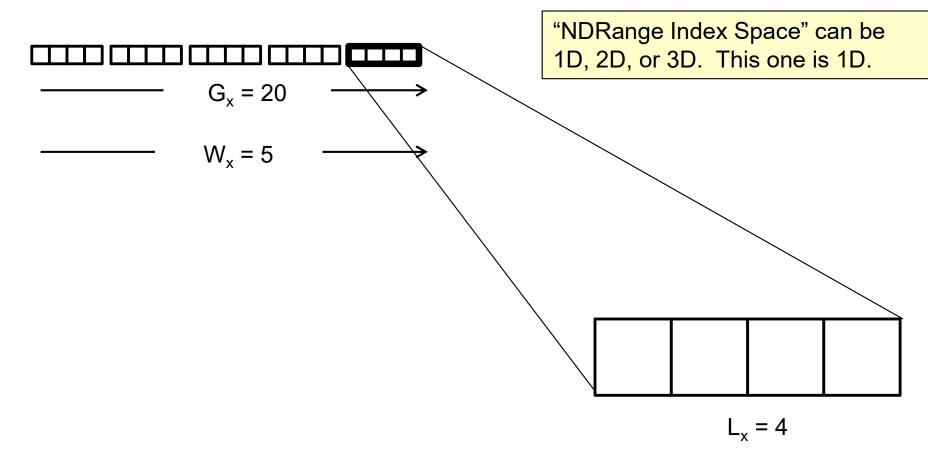

11. Enqueue the Kernel Object for Execution

```
size t globalWorkSize[3] = { NUM ELEMENT, 1, 1 };
  size t localWorkSize[3] = { LOCAL SIZE, 1, 1 };
  Wait( cmdQueue );
                      // will be covered in the OpenCL event notes
  double time0 = omp get wtime();
  status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL);
  Wait( cmdQueue );
                        // will be covered in the OpenCL event notes
  double time1 = omp get wtime();
                                                # dimensions
                                                                                                    event object
                                                                                         # events
status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL);
                                                     global work
                                                                                                   event wait
                                                        offset
                                                                                                      list
                                                    (always NULL)
             Execute

"NDRange Index Space" can be 1D, 2D, or 3D. This one is 3D.

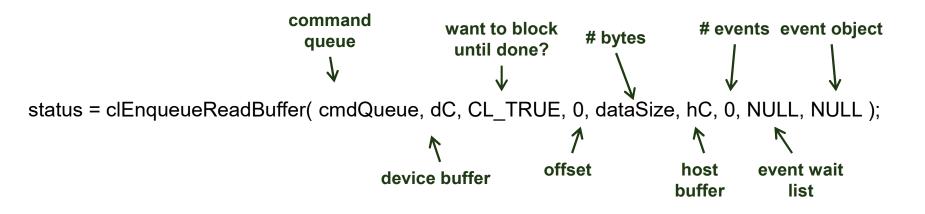

Figuring Out What Thread You Are and What Your Thread Environment is Like

```
get_work_dim();
uint
       get_global_size( uint dimindx ) ;
        get_global_id( uint dimindx ) :
size t
        get_local_size( uint dimindx );
size t
        get_local_id( uint dimindx ) ;
size t
size t
        get num groups( uint dimindx );
       get_group_id( uint dimindx ) ;
size t
       get_global_offset( uint dimindx ) ;
size t
                                                    0 < dimindx < 2
```

12. Read the Results Buffer Back from the Device to the Host

status = clEnqueueReadBuffer(cmdQueue, dC, CL_TRUE, 0, dataSize, hC, 0, NULL, NULL);

```
// clean everything up:

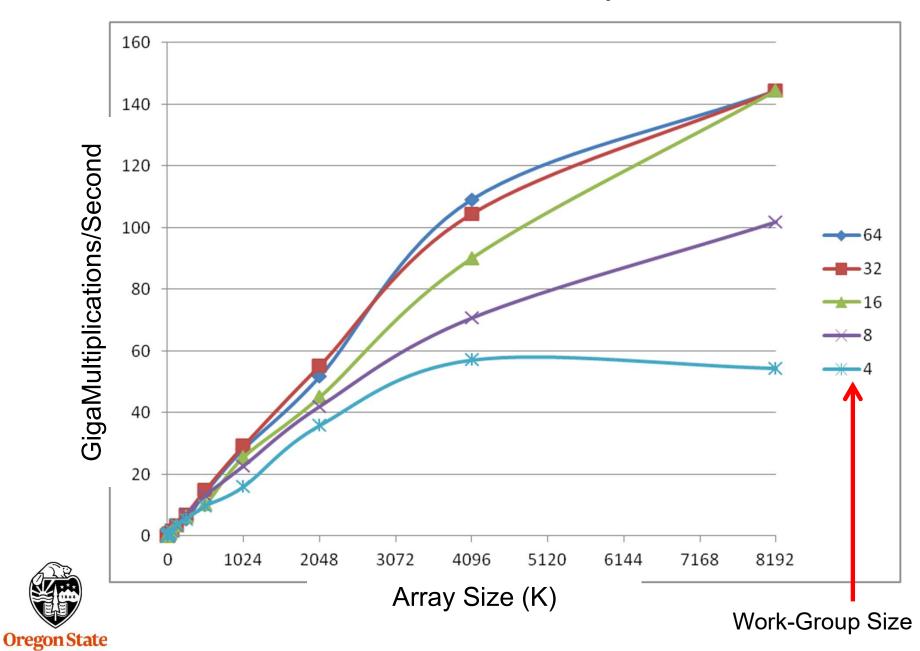

clReleaseKernel( kernel );
clReleaseProgram( program );
clReleaseCommandQueue( cmdQueue );
clReleaseMemObject( dA );
clReleaseMemObject( dB );
clReleaseMemObject( dC );

delete [ ] hA;
delete [ ] hB;
delete [ ] hC;

Do this because we created these arrays with new
```

Writing out the .cl Program's Binary Code

```
size t binary sizes;
status = clGetProgramInfo( Program, CL_PROGRAM_BINARY_SIZES, 0, NULL, &binary_sizes );
size t size;
status = clGetProgramInfo( Program, CL_PROGRAM_BINARY_SIZES, sizeof(size_t), &size, NULL );
unsigned char *binary = new unsigned char [ size ];
status = clGetProgramInfo( Program, CL PROGRAM BINARIES, size, &binary, NULL );
FILE *fpbin = fopen( "particles.nv", "wb" );
if( fpbin == NULL )
    fprintf( stderr, "Cannot create 'particles.bin'\n" );
else
    fwrite( binary, 1, size, fpbin );
    fclose(fpbin);
delete [] binary;
```

Importing that Binary Code back In:

8. Compile and Link the Kernel Code

Instead of doing this:

```
char * strings [ 1 ];
strings[0] = clProgramText;
cl_program program = clCreateProgramWithSource( context, 1, (const char **)strings, NULL, &status );
delete [ ] clProgramText;
```

You would do this:

```
unsigned char byteArray[ numBytes ];
cl_program program = clCreateProgramWithBinary( context, 1, &device, &numBytes, &byteArray, &binaryStatus, &status );
delete [ ] byteArray;
```

And you still have to do this:
