

Arithmetic Operations Among Threads – A Problem 21 float sum = 0.: #pragma omp parallel for default(none), shared(sum)
for(int i = 0; i < N; i++)</pre> float myPartialSum = ... sum = sum + myPartialSum; < } There is no guarantee when each thread will execute this line • There is not even a guarantee that each thread will finish this line before some other thread interrupts it. (Remember that each line of code usually generates multiple lines of assembly.) This is non-deterministic ! Assembly code: Load sum What if the scheduler Add myPartialSum decides to switch Store sum threads right here? 15 University Conclusion: Don't do it this way!

Synchronization Example		25
omp_lock_t Sync; omp_init_lock(&Sync);		
 while(omp_test_lock(&Sync) == 0) { DoSomeUsefulWork_0(); }	Thread #1: while(omp_test_lock(&Sync) == 0) { DoSomeUsefulWork_1(); }
