Acknowledgements

First of all, thanks to the inaugural class of 19 students who braved new, unrefined, and just-in-time course materials to take the first Vulkan class at Oregon State University – Winter Quarter, 2018. Thanks for your courage and patience!

Ali Alsalehy	Alan Neads
Natasha Anisimova	Raja Petroff

History of Shaders

2004: OpenGL 2.0 / GLSL 1.10 includes Vertex and Fragment Shaders

2008: OpenGL 3.0 / GLSL 1.30 adds features left out before

2010: OpenGL 3.3 / GLSL 3.30 adds Geometry Shaders

2010: OpenGL 4.0 / GLSL 4.00 adds Tessellation Shaders

2012: OpenGL 4.3 / GLSL 4.30 adds Compute Shaders

2017: OpenGL 4.6 / GLSL 4.60

There is lots more detail at:

https://www.khronos.org/opengl/wiki/History_of_OpenGL

History of Shaders

2014: Khronos starts Vulkan effort

2016: Vulkan 1.0

2016: Vulkan 1.1

2020: Vulkan 1.2

There is lots more detail at:

[https://en.wikipedia.org/wiki/Vulkan_\(API\)](https://en.wikipedia.org/wiki/Vulkan_(API))

mjb - June 26, 2020

Who was the original Vulcan?

9

From Wikipedia:

"Vulcan is the god of fire including the fire of volcanoes, metalworking, and the forge in ancient Roman religion and myth. Vulcan is often depicted with a blacksmith's hammer. The **Vulcanalia** was the annual festival held August 23 in his honor. His Greek counterpart is Hephaestus, the god of fire and smithery. In Etruscan religion, he is identified with Sethlans. Vulcan belongs to the most ancient stage of Roman religion: Varro, the ancient Roman scholar and writer, citing the *Annales Maximi*, records that king Titus Tatius dedicated altars to a series of deities among which Vulcan is mentioned."

Who is the Khronos Group?

11

The **Khronos Group, Inc.** is a non-profit member-funded industry consortium, focused on the creation of open standard, royalty-free application programming interfaces (APIs) for authoring and accelerated playback of dynamic media on a wide variety of platforms and devices. Khronos members may contribute to the development of Khronos API specifications, vote at various stages before public deployment, and accelerate delivery of their platforms and applications through early access to specification drafts and conformance tests.

Who's Been Specifically Working on Vulkan?

Oregon State University
 Computer Graphics

mjb - June 26, 2020

Vulkan

- Originally derived from AMD's *Mantle* API
- Also heavily influenced by Apple's *Metal* API and Microsoft's *DirectX 12*
- Goal: much less driver complexity and overhead than OpenGL has
- Goal: much less user hand-holding
- Goal: higher single-threaded performance than OpenGL can deliver
- Goal: able to do multithreaded graphics
- Goal: able to handle tiled rendering

Oregon State University
 Computer Graphics

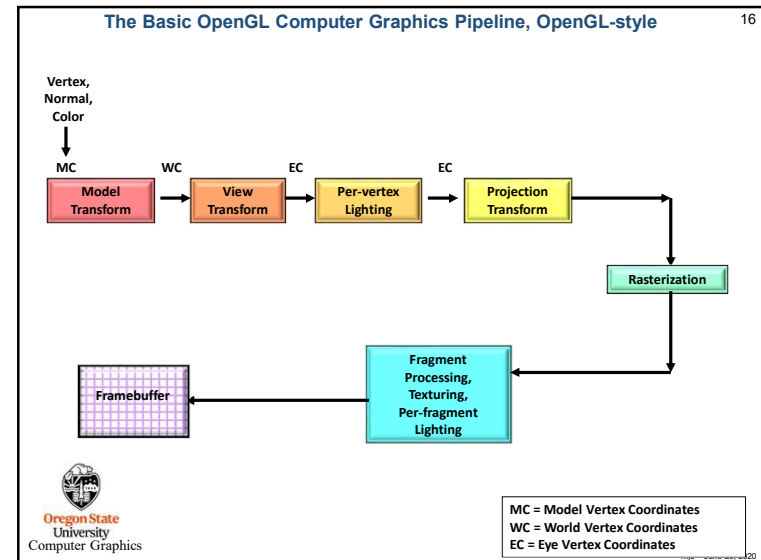

mjb - June 26, 2020

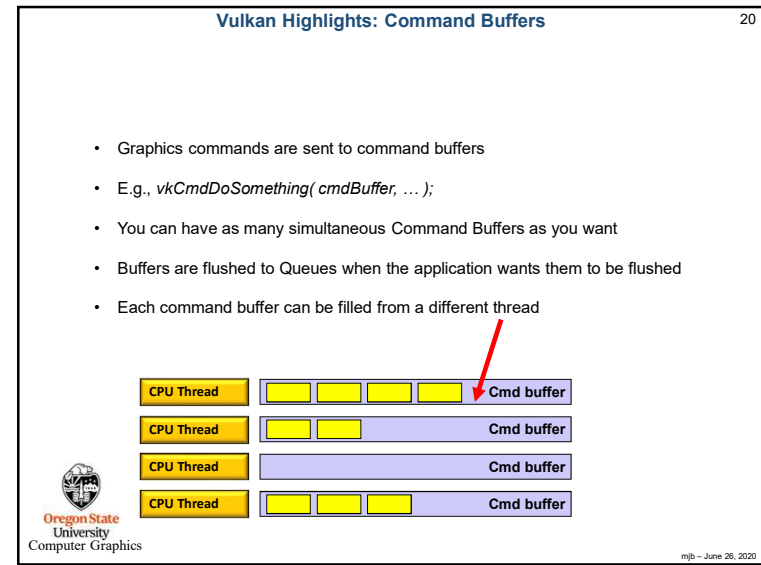

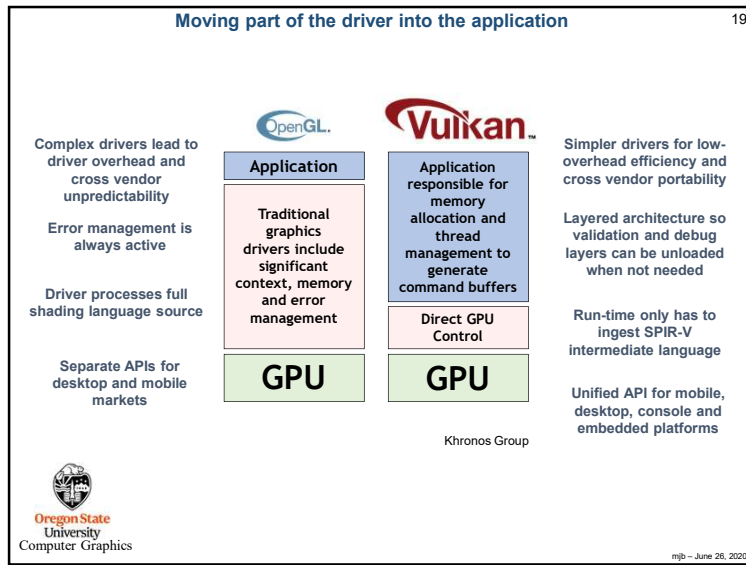

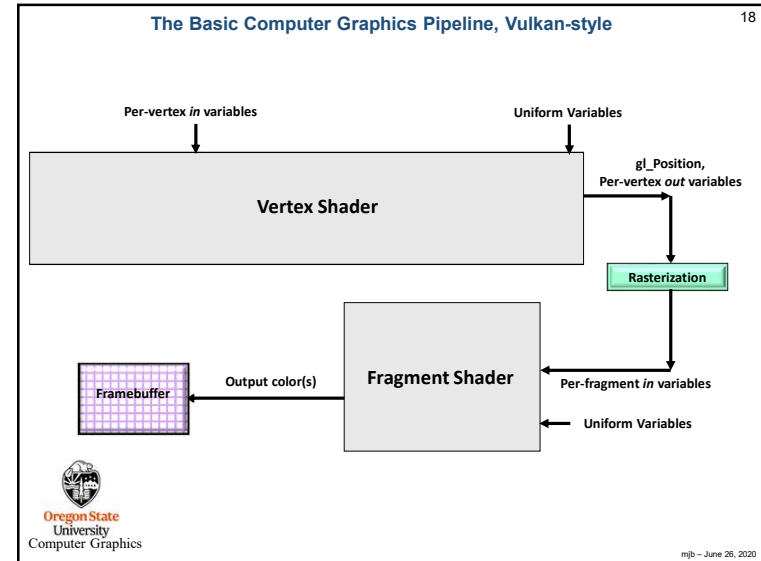

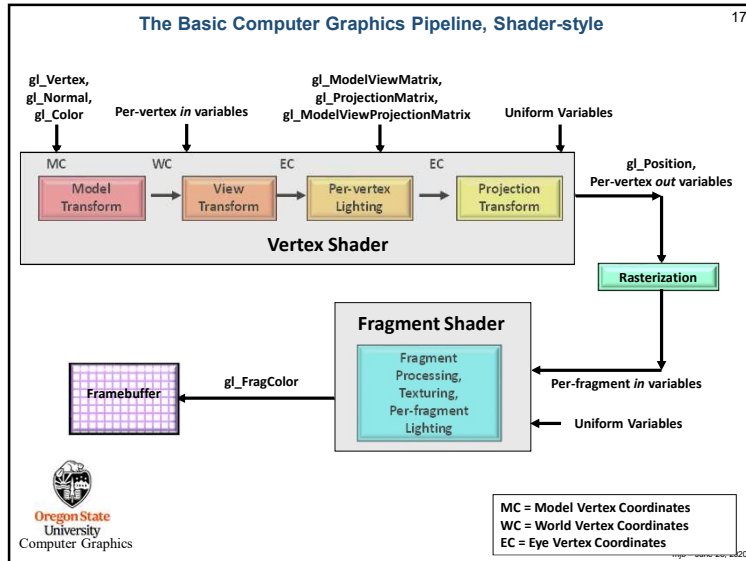

Vulkan Differences from OpenGL

- More low-level information must be provided (by you!) in the application, rather than the driver
- Screen coordinate system is Y-down
- No "current state", at least not one maintained by the driver
- All of the things that we have talked about being *deprecated* in OpenGL are *really deprecated* in Vulkan: built-in pipeline transformations, begin-end, fixed-function, etc.
- You must manage your own transformations.
- All transformation, color and texture functionality must be done in shaders.
- Shaders are pre-"half-compiled" outside of your application. The compilation process is then finished during the runtime pipeline-building process.

 Computer Graphics

mjb - June 26, 2020

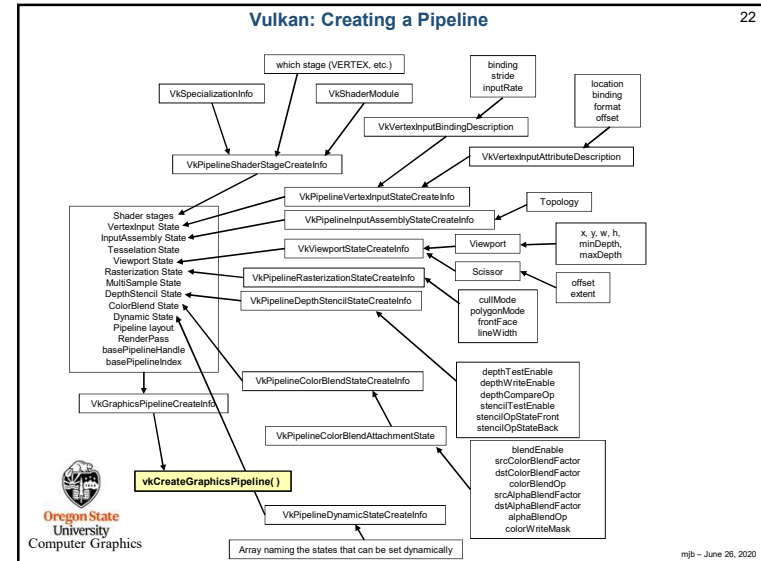

Vulkan Highlights: Pipeline State Objects

21

- In OpenGL, your "pipeline state" is the combination of whatever your current graphics attributes are: color, transformations, textures, shaders, etc.
- Changing the state on-the-fly one item at-a-time is very expensive
- Vulkan forces you to set all your state variables at once into a "pipeline state object" (PSO) data structure and then invoke the entire PSO *at once* whenever you want to use that state combination
- Think of the pipeline state as being immutable.
- Potentially, you could have thousands of these pre-prepared pipeline state objects

mjb - June 26, 2020

Querying the Number of Something

23

```
uint32_t count;
result = vkEnumeratePhysicalDevices( Instance, OUT &count, OUT (VkPhysicalDevice *)nullptr );

VkPhysicalDevice * physicalDevices = new VkPhysicalDevice[ count ];
result = vkEnumeratePhysicalDevices( Instance, OUT &count, OUT physicalDevices );
```

This way of querying information is a recurring OpenCL and Vulkan pattern (get used to it):

	How many total there are	Where to put them
result = vkEnumeratePhysicalDevices(Instance, &count, nullptr);	↓	↓
result = vkEnumeratePhysicalDevices(Instance, &count, physicalDevices);		

mjb - June 26, 2020

Vulkan Code has a Distinct "Style" of Setting Information in structs and then Passing that Information as a pointer-to-the-struct

24

```
VkBufferCreateInfo vbci;
vbci.sType = VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO;
vbci.pNext = nullptr;
vbci.flags = 0;
vbci.size = << buffer size in bytes >>
vbci.usage = VK_USAGE_UNIFORM_BUFFER_BIT;
vbci.sharingMode = VK_SHARING_MODE_EXCLUSIVE;
vbci.queueFamilyIndexCount = 0;
vbci.pQueueFamilyIndices = nullptr;

VK_RESULT result = vkCreateBuffer ( LogicalDevice, IN &vbci, PALLOCATOR, OUT &Buffer );

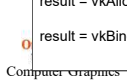

VkMemoryRequirements vmr;

result = vkGetBufferMemoryRequirements( LogicalDevice, Buffer, OUT &vmr ); // fills vmr

VkMemoryAllocateInfo vmai;
vmai.sType = VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO;
vmai.pNext = nullptr;
vmai.flags = 0;
vmai.allocationSize = vmr.size;
vmai.memoryTypeIndex = 0;

result = vkAllocateMemory( LogicalDevice, IN &vmai, PALLOCATOR, OUT &MatrixBufferMemoryHandle );

result = vkBindBufferMemory( LogicalDevice, Buffer, MatrixBufferMemoryHandle, 0 );
```

Steps in Creating Graphics using Vulkan

29

1. Create the Vulkan Instance
2. Setup the Debug Callbacks
3. Create the Surface
4. List the Physical Devices
5. Pick the right Physical Device
6. Create the Logical Device
7. Create the Uniform Variable Buffers
8. Create the Vertex Data Buffers
9. Create the texture sampler
10. Create the texture images
11. Create the Swap Chain
12. Create the Depth and Stencil Images
13. Create the RenderPass
14. Create the Framebuffer(s)
15. Create the Descriptor Set Pool
16. Create the Command Buffer Pool
17. Create the Command Buffer(s)
18. Read the shaders
19. Create the Descriptor Set Layouts
20. Create and populate the Descriptor Sets
21. Create the Graphics Pipeline(s)
22. Update-Render-Update-Render- ...

Vulkan GPU Memory

30

- Your application allocates GPU memory for the objects it needs
- To write and read that GPU memory, you map that memory to the CPU address space
- Your application is responsible for making sure that what you put into that memory is actually in the right format, is the right size, has the right alignment, etc.

Oregon State
University
Computer Graphics

mjb - June 26, 2020

Vulkan Render Passes

31

- Drawing is done inside a render pass
- Each render pass contains what framebuffer attachments to use
- Each render pass is told what to do when it begins and ends

Oregon State
University
Computer Graphics

mjb - June 26, 2020

Vulkan Compute Shaders

32

- Compute pipelines are allowed, but they are treated as something special (just like OpenGL treats them)
- Compute passes are launched through dispatches
- Compute command buffers can be run asynchronously

Oregon State
University
Computer Graphics

mjb - June 26, 2020

Vulkan Synchronization

33

- Synchronization is the responsibility of the application
- Events can be set, polled, and waited for (much like OpenCL)
- Vulkan itself does not ever lock – that’s your application’s job
- Threads can concurrently read from the same object
- Threads can concurrently write to different objects

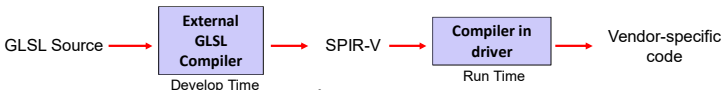

mjb -- June 28, 2020

Vulkan Shaders

34

- GLSL is the same as before ... almost
- For places it’s not, an implied `#define VULKAN 100` is automatically supplied by the compiler
- You pre-compile your shaders with an external compiler
- Your shaders get turned into an intermediate form known as SPIR-V (Standard Portable Intermediate Representation for Vulkan)
- SPIR-V gets turned into fully-compiled code at runtime
- The SPIR-V spec has been public for years –new shader languages are surely being developed
- OpenCL and OpenGL have adopted SPIR-V as well

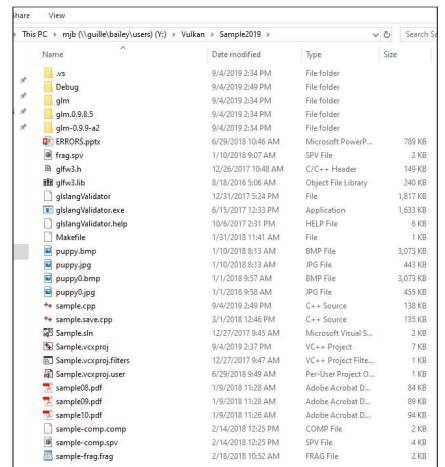

Advantages:

1. Software vendors don’t need to ship their shader source
2. Software can launch faster because half of the compilation has already taken place
3. This guarantees a common front-end syntax
4. This allows for other language front-ends

Your Sample2019.zip File Contains This

35

Or, The “19” refers to the version of Visual Studio, not the year of development.
